

LocalDeck

Kanban. Local. Secure. Private.

IT Review and Approval Summary

Executive Summary

Application: LocalDeck

Developer: Anthony Nunez / @CafecitoExpress95

Application Source: <https://github.com/CafecitoExpress95/LocalDeck>

Application Type: Local-first Kanban and personal task organization application

Deployment Model: Local desktop application and optional browser-based static deployment

Terms of Use: Commercial Use Permitted; Open-Sourced via GPL-3.0 License (See **Application Source** for full license terms)

Target Users: Individual contributors organizing their own work and tasks

Approval Scope Requested: Optional individual contributor usage only

LocalDeck is a lightweight, local-first Kanban and personal organization application designed for individual contributors who want additional personal task visibility and structure without depending on cloud-hosted SaaS platforms.

The application is intentionally **not** intended to replace enterprise project management systems such as:

- Microsoft Project
- Smartsheet
- Jira

LocalDeck is positioned as an *optional*, personal productivity layer used by individual contributors for organizing their own workflow, notes, and task visibility in a non-team-impacting manner.

The application is designed around the following principles:

- Local-first data ownership
- Offline capability
- No accounts
- No subscriptions
- No telemetry
- No required cloud back-end
- Lightweight desktop operation
- Open-source transparency

LocalDeck

Kanban. Local. Secure. Private.

Business Justification

Many enterprise task management systems are optimized for organizational coordination, portfolio visibility, ticket routing, reporting, and cross-team collaboration. Individual contributors frequently still maintain supplemental personal workflows outside those systems to organize:

- Personal work queues
- Research tracking
- Engineering notes
- Prioritization
- Temporary project structures
- Offline planning
- Independent task decomposition

LocalDeck provides a structured and visual method for this individual organization while intentionally **avoiding** external cloud dependencies and account-based SaaS requirements.

Key operational benefits include:

- Local-only task organization
- Reduced dependency on cloud productivity tooling
- Offline functionality during travel or field work
- User-controlled storage and exports
- Minimal infrastructure impact
- No organizational workflow disruption

The application is intended to complement existing enterprise systems rather than replace them.

Technical Overview

Category	Details
Front-End	SvelteKit + TailwindCSS
Desktop Runtime	Tauri 2
Local Storage	IndexedDB via Dexie.js
Distribution	GitHub Releases
Supported Platforms	Windows x64, Linux x64, macOS
Authentication	None required
Accounts Required	No
Cloud Back-End	None required
Offline Support	Yes
Data Export	Portable .board archive files
Administrative Rights	Not intended for normal runtime operation

Board data is stored locally using IndexedDB and portable .board archive files. Boards are intended to remain user-controlled and portable.

Conceptual architecture:

LocalDeck

Kanban. Local. Secure. Private.

Security and Privacy Overview

Data Handling

- Data is stored locally on the user's machine
- No mandatory cloud synchronization
- No required external account system
- No telemetry or analytics are part of the project goals
- No hosted backend infrastructure required for core usage

Network Behavior

LocalDeck is designed primarily as a local-first application.

Expected network usage may include:

- GitHub release downloads
- Optional GitHub Pages demo access
- Optional update checks if implemented in future releases

The application is not designed around continuous cloud communication or SaaS synchronization workflows.

Security Characteristics

Area	Status
Local-first operation	Yes
Offline capable	Yes
Open source	Yes
Mandatory telemetry	No
Mandatory accounts	No
Cloud dependency	No
Portable exports	Yes
User-controlled storage	Yes

The project also explicitly states:

"The goal is not to replace every project management suite. The goal is to provide a focused, dependable board application that feels good to use and respects the person using it."

LocalDeck

Kanban. Local. Secure. Private.

Risk Assessment

Risk	Impact	Mitigation
User stores sensitive organizational data improperly	Potential local data exposure	Restrict usage to appropriate internal/non-regulated workflows
Local workstation compromise	Exposure of locally stored board data	Standard endpoint protection and disk encryption policies
User confusion regarding enterprise workflow authority	Process fragmentation	Position application strictly as optional personal organization tooling
Local archive corruption or deletion	Loss of user-managed board data	Portable export and backup functionality

LocalDeck is intended for personal task organization and lightweight workflow visualization. It should not be considered a system of record for enterprise portfolio management, compliance tracking, or regulated data handling.

Infrastructure and Operational Impact

Area	Expected Impact
Server infrastructure	None
Firewall changes	None expected
Proxy exceptions	None expected
Database infrastructure	None
Authentication integration	None
SaaS onboarding	None
Identity management	None
Ongoing infrastructure maintenance	Minimal

The application's local-first architecture substantially reduces enterprise infrastructure dependencies compared to traditional SaaS project management platforms.

Kanban. Local. Secure. Private.

Recommendation

LocalDeck appears suitable for optional individual contributor usage where users desire additional personal task organization capabilities outside formal enterprise project management systems.

Recommended approval scope:

Optional individual contributor usage for personal task organization and non-regulated workflow management.

Recommended limitations:

- Not a replacement for official enterprise project management tooling
- Not intended for regulated or highly sensitive data
- Not intended as a formal system of record
- Subject to standard endpoint security controls and acceptable use policies

The application's local-first architecture, lack of mandatory telemetry, minimal infrastructure impact, and open-source transparency present a comparatively low operational footprint for evaluation.
